

This is actually the most important part of **flowmaster**. My vision is that it's very easy to set up and change later, and gets everything done with minimal UI. For this reason, having really effective default settings would be ideal so people don't even need to go in and change them. We must anticipate how most people are using it (like me) and give them those settings by default.

Recording settings + tab

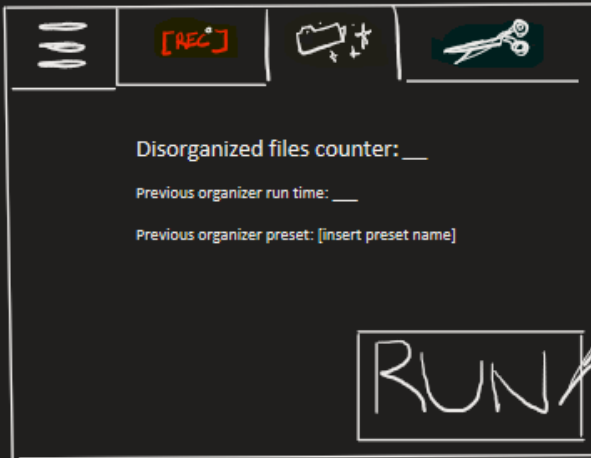

For record, I do want there to be a simple track layout and mixer, similar to FL. This way you can see the interface is pushing you to record multiple things at once so it can organize them together for you.

- On "RECORD",
- > Txt file created in the same location as v1 or a1 (for file creation timing)
 - > User is either prompted for a session name or not (then using default) depending on preference.
 - > Session name is written to top of text file along with other information:
 - o Day's date, local time, user name... Session name. A visual barrier... "/n/n _ _ _ _ _"
 - o Program automatically minimizes to system tray + taskbar emblem shows recording
 - > Rec tab should display "Background recording in progress (previews minimized for efficiency)."
 - o Preview of what's happening on the recording does not open unless user clicks on inputs (v1 v2 v3 or a1 a2 a3) OR has set settings to "automatically open preview screen."

(2) FILEORGANIZER TAB

We need a way to **gui** on whether we are doing this to all their files or just one (do all by default)

Opens run window

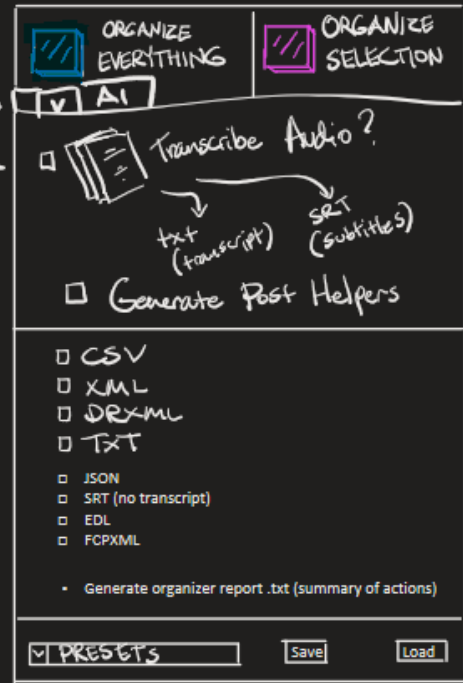

Display disorganized file count

in ORGANIZER TAB with FUNCTION

With the file organizer, as soon as the user opens the tab it needs to call a function, the function will be "assess" or "review folder". During the opening of the fileorganizer tab, it should quickly display how many un organized files they have currently. The **Fileorganizer** will only count one entry if it can detect a pair Video file in mkv and txt file created within **some** time of that. It will also go to all the file paths the user has previously told the fileorganizer to go to to look for other created video files. If it finds **different** video files which are also outside of a folder that isn't bearing a session name

I'm typing too much.

Tldr, the **fileorganizer** tab needs to **diplay** to the user how many files are currently out of organization in **RED** (untouched by fileorganizer) so that they have a gauge of how many files they could organize if they ran that function.

Fileorganizer should write a trace of its involvement to the files metadata somewhere.

Eg. "File organized by **Flowmaster**"

- RECOMMENDATIONS
- 1. Identify & mark
- 2. Organize them
- 3. Generate all n timestamp).
- 4. THEN: Ask the user: "Would you like to keep the original files?"
- 5. If yes:
 - Remove the original files
 - Update the metadata
 - Keep the original files
